

in the neighborhood of

The final sort ; as we move to the right with the sub-keys ; there is a limit that we can stop looking for factors. We only need to test to  $1/7$  or 0.142859. Since seven (7) is our starting point in the search with \*fam07. We only need to test for 'just another thirty away' until  $1/7$  of PS.

The limit will need to be adjusted for integer math vs decimal math. The formula is \*ratio = [ int(PS \*  $1/7$ ) + 1 ] or \*ratio = [ int(PS \* 0.142859) + 1 ]. In the next set of pages will show the groundwork to pick  $1/7$  as the limit.

In order to determine in the traditional manner if a number is prime we test all values from one (1) all the way to the PS (Prime Suspect).

Example: 7 test from 1 to 7 ( 1 , 2 , 3 , 4 , 5 , 6 , 7 ).

Example: 21 test from 1 to 21 ( 1 , 2 , 3 , 4 , 5 , 6 , 7 , . . . , 20 , 21 ).

Factors are hilted in blue.

**With seven (7) the ends one (1) and seven (7) are both with a zero (0) and yellow color. All the other columns have a numeric value greater than zero (0) and are light gray. Look at twenty-one (21) ; the columns for three (3) and seven (7) are zero (0) and yellow color. This is a visual presentation of the data to tune your thinking and eyesight as we move forward.**

Overlaying the above MOD() table is the opposite , a multiplication table. Looking at the green cell diagonally down the middle is the square of the PS (Prime Suspect).

7 \* 7 = 49 ; 21 \* 21 = 441.

[illegible]

**This is the inverse of the \*fam for the eight equations.**

**Generated by “1 seventh 0b.xlsx”**

**Use tab “ratio look up” to test data.**

On to the next search . . .

The far-right red slash is the corner away from the PS. It is the column of PS.

The red boxes and red numbers inside are the value of seven (7) and its MOD() $\equiv$ 0.

This is 1/7 (0.142859) of the total for the row.

All other \*fam are less than 1/7.

\*fam01 = 1/1 = 1 (highest probability of prime)

\*fam07 = 1/7 = 0.124859

\*fam11 = 1/11 = 0.090909

\*fam13 = 1/13 = 0.076923

\*fam17 = 1/17 = 0.058823

\*fam19 = 1/19 = 0.052631

\*fam23 = 1/23 = 0.043478

\*fam29 = 1/29 = 0.034482 (lowest probability of prime)

**The last sort – start here**

**Everything to the left of the red 7 boxes is where to look up to after making the right turn. It is the limit of the search using the sub-keys.**

**The three below screen prints are contiguous segments showing \*fam07 and 1/7 and 0.142859.**

**Note the curve formed by the weight of the numbers. The numbers by themselves present a graph. Follow the seven line. The sets of lines to the right of \*fam07 are \*fam01 , \*fam02 , \*fam03 , . . . , \*fam06. Which have been discarded using prior sorts.**

**Take note in the 2<sup>nd</sup> and 3<sup>rd</sup> slides of the wave to the left of \*fam07. More latter some other day. These appear to be of a mammatus formation.**

```
try = int( PS / 7 ) + 1
```

[illegible]

**Look at 23 – prime ; look at all of his neighbors. There is at least one  yellow zero within the number of tries four (4).**

**Looking at 59 and 61 , both fall in the 'try' of nine (9).**

<b>'try decmial' PS (103) * ratio (0.1429)</b>	<b>14.714286</b>	
<b>int(try decimal)</b>	<b>14.000000</b>	
<b>plus 1</b>	<b>1</b>	<b>round up +1 - account for decimal</b>
<b>try</b>	<b>15</b>	<b>try 15 times ; if no MOD() = zero , then prime</b>
<b>limit</b>	<b>1545</b>	<b>(try times PS) = limit = (15 times 103) = 1545</b>
		<b>if it is not going to happen in the first 1/7 then it is a prime</b>
		<b>look 'in the neighborhood of' related try's</b> <b>all the neighbors have at least one MOD() = 0</b>  <b>"within reason . . ."</b>

[illegible]

**The fifteen column is the max number of tries. The other values ‘in the neighborhood’**

have at least one **0** yellow zero within the number of tries fifteen.

**If it has not happened within fifteen (15) tries it is not going to happen. Must be prime.**

Here is an image of a range surrounding two primes (134999 and 135007) and their “in the neighborhood’ numbers.
